

## Team 5

### Top-Level L0 diagram

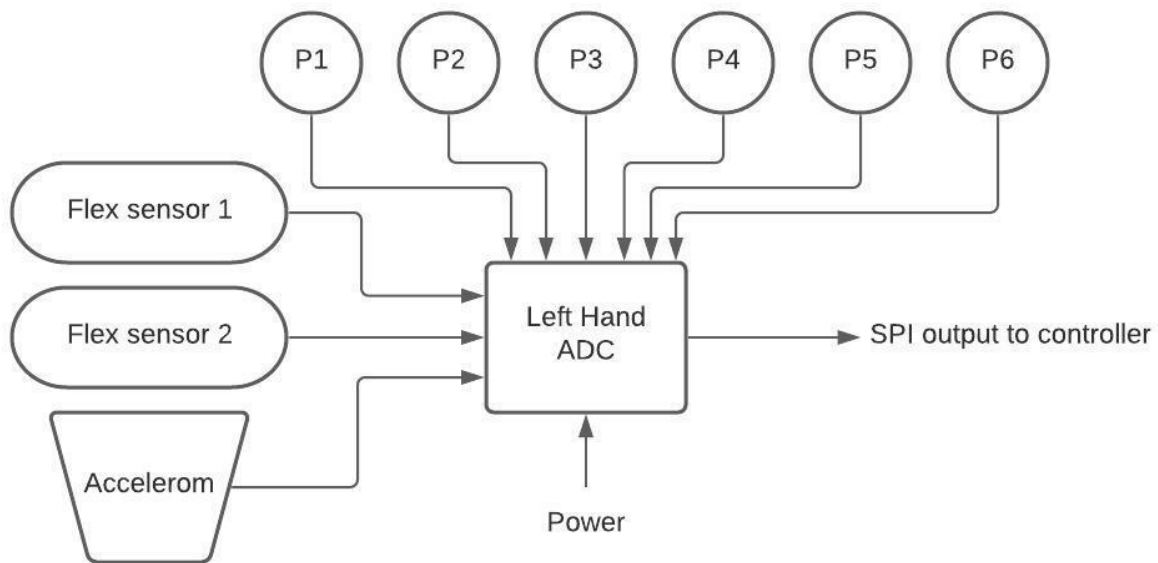

Module	Wearable MIDI controller
Input	<p>Left and Right Hand ADC: The sensors distributed on each input sense the movement changes and send out corresponding signals. SPI input to Teensy controller.</p> <p>Power: USB Power: +5V, 150mA</p>
Output	MIDI events through USB to the computer
Functionality	Translates hand movements into MIDI events for controlling a digital instrument on the computer

L1 diagram

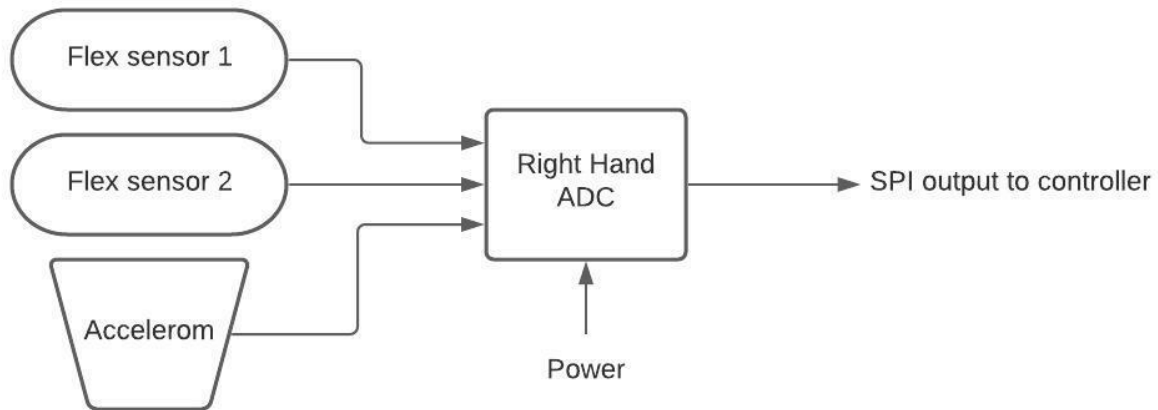

Left Hand L0 diagram

Module	Left Hand Sensors
Input	<p>Power: 3.3v from Teensy</p> <p>6x Piezo elements: voltage spikes (under 3.3v) with threshold that triggers an event, and voltage level that sets an intensity, analog input to the ADC. Can be tapped to trigger an event.</p> <p>2x Flex sensors (adafruit 182): each is set up in a voltage divider, output voltage is an analog input to the ADC. Measures how bent the index and middle fingers are.</p> <p>Accelerometer (ADXL362): SPI input to ADC. Measures tilt and acceleration of the hand.</p>
Output	SPI output from ADC to Teensy
Functionality	Takes analog and digital input and translates it to digital SPI which is sent to the controller to be processed

## Right Hand L0 diagram

Module	Right Hand Sensors
Input	<p>Power: 3.3v from Teensy</p> <p>2x Flex sensors (adafruit 182): each is set up in a voltage divider, output voltage is an analog input to the ADC. Measures how bent the index and middle fingers are.</p> <p>Accelerometer (ADXL362): SPI input to ADC. Measures tilt and acceleration of the hand.</p>
Output	SPI output from ADC to Teensy
Functionality	Takes analog and digital input and translates it to digital SPI which is sent to the controller to be processed
